

1895, Red Snapper, Glasslift 250,

The glasslift 250 is a luxurious form of the triangle car, .

it drives manually but all other moves are hydraulic carried. It is available with a 4 naps vacuum lifter fixed, but also as shown with a loose vacuum pad to the short cable, it makes moving much easier to place the glassplate the last few mm. The device is not removable, but can drive easy through a normal door as the wheels are replaced. He is only suitable for the ground floor, and a solid surface. We advice the machine only for the building site. For moving glassplate in the glass factory there are more suitable materials available.

2009: At this moment there is also a "glasslift" available which drives automatic, so you just stand on the back.
